

SludgeHammer®

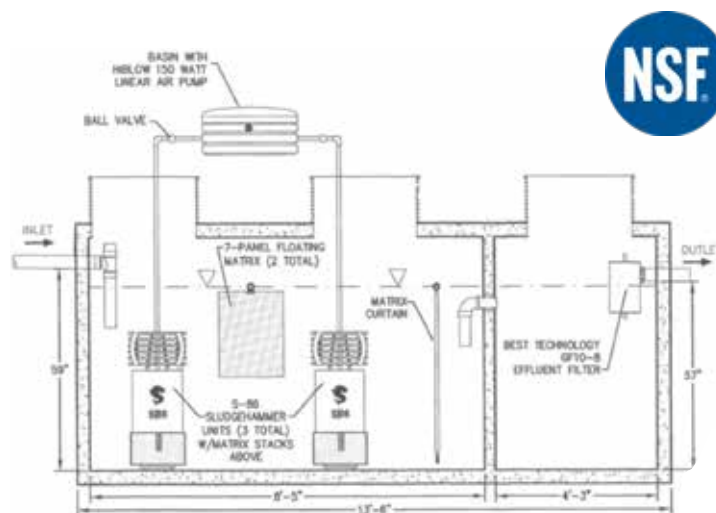

residential S|1000

The SludgeHammer S-1000 is a system designed for single family residences with up to 1,000 gallons of wastewater per day (GPD). This system should be used wherever advanced treatment is necessary.

The S-1000 system meets all NSF/ANSI Class 1 standards when tested by NSF International. The model is installed in the inlet chamber of a 3,000 gallon standard septic tank. The S-1000 treats wastewater similarly to the S-400 where the SludgeHammer Blend™ of bacteria and enzymes supplies aerated liquid to break down organic matter. The column of the SludgeHammer unit is also filled with air to displace liquid and circulate all liquid entering and leaving the column.

This model series is certified through NSF 40, Class 1 as Advanced Treatment Units. The SludgeHammer S-1000 model treats domestic wastewater loads up to 1,000 gallons per day. They provide the most economical and effective treatment on the market.

The SludgeHammer S-1000 is part of our residential wastewater treatment product line.
